3.   Command format

Command format overview
The command format is as follows.

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8	…	Byte n
LF	ID	Command		Data 1	Data 2	Data 3	Data 4	…	CR

Commands begin with a "line feed (LF)," end with a "carriage return (CR)," and are based on the ASCII format.
The type following the LF is the machine ID. The machine ID is described later.
Commands are expressed by two ASCII bytes.
The byte string following the command expresses the data, and is between 0 bytes (for a command that has no data) and a maximum of 98 bytes. For details on the data, refer to the detailed explanation for each command. For commands that use 0‑‑9 and A‑‑F as data values, uppercase characters are used for A‑‑F.

Example commands
Example 1:   Transmitting a PLAY command to a controlled device of ID=0
    When the controlled device is in Stop or Ready mode, this command will initiate playback on the controlled device.
    The PLAY command is [12], and is transmitted as follows.

	ID	Command		
		ID	Command	
ASCII	LF	0	1	2	CR
HEX	0Ah	30h	31h	32h	0Dh

Example 2:   Telling a controlled device of ID=0 to perform a direct search for track 123
    The command "DIRECT TRACK SEARCH PRESET [23]" is transmitted to perform this action.
    The data bytes consist of ASCII in two‑byte units.
    For the "DIRECT TRACK SEARCH PRESET" command, the track number is specified as follows.
        Data 1   Tens digit of the specified track number
        Data 2   Ones digit of the specified track number
        Data 3   Thousands digit of the specified track number
        Data 4   Hundreds digit of the specified track number
    Thus, the transmitted command will be as follows.

	ID	Command		Data：track 123				
ASCII	LF	0	2	3	2	3	0	1	CR
HEX	0Ah	30h	32h	33h	32h	33h	30h	31h	0Dh

Example 3:   Writing a title to track 23 of a controlled device whose ID=0
    The command "TEXT PRESET [29]" is transmitted to perform this action.
    This command allows up to eighty single‑byte characters to be transmitted.
    For example, the command to write a title "Test" would be as follows.

	ID	Command		Track 23				Title：Test				
ASCII	LF	0	2	9	2	3	0	0	T	e	s	t	CR
HEX	0Ah	30h	32h	39h	32h	33h	30h	30h	54h	65h	73h	74h	0Dh

Machine ID
The CD‑RW901 MKⅡ uses Machine ID=0 to receive commands and transmit returns.
Commands and returns using Machine ID=0 also exist, and these operations are described within this document.
If a command with an ID other than Machine ID=0 is received, that command is ignored.
If an unsupported command is received, the controlled device will transmit ILLEGAL [F2].

Command sequence

In most cases the controlled device will not send an ACK in response to transport control or data preset commands sent from the external controller.

The controlled device will send back a return command in response to data sense commands that request a data value specified on the controlled device.

When the status of the controlled device changes, such as from Stop to Play mode, or when an error etc. occurs, the controlled device will send a command indicating this to the external controller.

Examples of the command sequence are given below.

You must leave an interval of at least 20 ms between commands.

Example 1:   Controlling the transport of the controlled device
This example describes the Play operation.
When the controlled device receives the PLAY command and enters Play mode, it will transmit a CHANGED STATUS command.
ACK is not transmitted for the PLAY command.

| Command | | State of controlled device |
External controller	Controlled device	
PLAY ->		Stopped
	<- CHANGED STATUS	Transmit when starting Play

Example 2:   Presetting data
This example describes setting the AUTO CUE LEVEL.
When the controlled device receives the AUTO CUE LEVEL PRESET (Preset) command, it will set its AUTO CUE LEVEL.
ACK is not transmitted for this command.

| Command | | State of controlled device |
External controller	Controlled device	
AUTO CUE LEVEL PRESET (Preset -54dB) ->		AUTO CUE LEVEL set to -54dB

Example 3:   Obtaining specified data
This example describes obtaining the currently-set AUTO CUE LEVEL.
When the controlled device receives the AUTO CUE LEVEL PRESET (Sense) command, it will return the currently-set AUTO CUE LEVEL.

| Command | | State of controlled device |
External controller	Controlled device	
AUTO CUE LEVEL PRESET (Sense) ->		
	<- AUTO CUE LEVEL RETURN	

Example 4:   Checking the status of the controlled device, and performing the next operation
When the operating status of the controlled device changes, it will transmit CHANGED STATUS. By using CHANGED STATUS as a trigger for sending MECHA STATUS SENSE, the new operating status can be determined.
This example shows how to check the record-ready status of the controlled device and then initiate recording..

| Command | | State of controlled device |
External controller	Controlled device	
RECORD (Record Ready) ->		Stopped

	<-	CHANGED STATUS	Transmitted when entering record-ready status
MECHA STATUS SENSE	->		
	<-	MECHA STATUS RETURN	Returns record-ready status
RECORD (Record)	->		
	<-	CHANGES STATUS	Transmitted when entering record status
